Higher Education eXternal Attribute Authority (**HEXAA**) is one of the innovation projects of the **GN3plus OpenCalls**. HEXAA is closely related to the European **eduGAIN** project, and potentially several pan-european research projects. The External Attribute Authority model frees the IdPs from handling the project-related attributes while empowering the research communities to collaborate with their own set of attributes relying solely on the **SAML** standard. The outcome of HEXAA project will be an open source software that acts as a standard SAML Attribute Authority compatible with **Shibboleth** and **simpleSAMLphp**. The software itself is written in php and is based on our contribution to ssp.

Please, help HEXAA project by completing a survey! You can help even more by sharing the survey with your users and colleagues. We hope that this ongoing survey will give us your valuable feedback that we can incorporate into the design of the HEXAA package. The survey is public, anonymous and it only takes about 10 minutes to complete. The survey is available at survey.hexaa.eu, where the results will be published as a white paper by the end of the project.
